

Usability

Our website uses a traditional method of navigation by having a navigation bar at the top of the screen. This allows each page to be concise and easy to read.

Educational Value

The main educational value of our website is targeted towards beginners who have little to no knowledge about malware. Our website will provide them with a brief overview of what malware is and show examples of phishing which will be a very likely thing they will run into. Then we describe the best practices to protect yourselves against these threats.

Interactivity

For our interactivity we included two quizzes. The phishing quiz will provide the user with real life examples of phishing and allows them to see visually what to look out for. The general quiz will provide feedback to the user to see if they actually grasp the concept and protections against malware.

Aesthetics

Our website has a simplistic design that is visually appealing. More could be done to improve this, like on different screen sizes our website looks quite different and some sizes look quite bad.
